Profile

After successfully spearheading the transition of a theoretical project into a data-driven PhD thesis, a computational biologist graduating from Georgia Tech in December 2018 is seeking a position that will combine their scientific rigor, computational acumen, and team-centric persona. Additional relevant skills and experience: team leading experience gained as a laboratory-course teaching assistant, mentoring experience through a graduate-undergraduate mentoring scholarship program, public speaking experience from presentations at international and domestic conferences, project management skills via providing computational analyses for five coworkers' projects during PhD candidacy, and written communication skills sharpened through academic journal article and grant writing.

Dissertation: *Data Mining the Atomic Structure of the Ribosome to Unravel the History of Protein Folding*

- **Summary:** The ribosome is present in every cell of life and is the molecular factory that makes protein according to information encoded within DNA sequence. Analyzing the atomic structures of the ribosome has revealed the interrelatedness and origin of life.
- **Results:** One 1st-author research article published, 2nd under review and 3rd in preparation.
- **Funding:** NASA Astrobiology Institute
- **Collaboration:** Computational analysis for coworkers' projects resulted in coauthor of 2 experimental and 3 computational research articles.
- **Communication:** Independently wrote and awarded \$7,000+ NSF grant to support summer research in Taiwan. Oral and poster presentations at 7 domestic and international scientific conferences.
- **Mentoring:** Awarded \$2,500 conference and travel funding for mentoring undergraduate student.
- **Courses:** 4 Biochemistry, 3 Biology, 3 Computer Science, 2 Korean, and 1 Math courses taken or audited. 1 certification for Business course.
